

CMfoni V1.1

Contact Manager for NETworkers

by
Seamless LLC

Overview:

CMfoni is a Contact Management System aggregating contact-information from different Social Networking Sites and local address-books.

Currently LinkedIn, Viadeo, Facebook and NING are supported – others are in planning.

Contacts are organized in so-called ContactBases and can be classified by a rating-system and tagging. CMfoni is using a sophisticated method obtaining contact-details from LinkedIn and Viadeo.

The application is now available on WIN-XX and Linux, MAC is planned soon.

There is no limitation on the number of contacts to be stored (only by disk-space).

Highlights:

- Unlimited number of ContactBases (some are directly related with Social Networks)
- Unlimited number of emails per contact (6 most recent are displayed)
- Every contact can be classified in the range from 1 (excellent) to 5 (bad)
- Add tags to each contact to group them – you can take over words eg from the LinkedIn-Specialties
- see, if you invited them or they invited you (good to know when you head towards 3000) when has the connection been established (important for LinkedIn-Users)
- see which contact have disconnected since the last sync with a network
- automatically download contacts from the supported networking sites and update the database
- import from different sources – a special functionality cleans up the name-fields (important for LinkedIn).
- Sync with PLAXO
- send round-mails, etc to selected contacts
- see the complete communication (mailboxes are parsed, either automatically or by hand) as for Thunderbird, Eudora and Outlook the individual mails are stored in an own file-system, so these are everytime accessible – independent in which mailbox they are moved later or even deleted.
- Direct-import of contacts from above mailers in different formats (eg .ldif, .vcf)
- Manage blog-addresses for each contact, choose which will be shown in your CM-favorite-list
- Attach individual notes, accessible over different ContactBases
- merge, copy and move contacts between different ContactBases
- Embedded Scheduler with a connection to the Contact-Database
- Insert of data from Contact-DB into tasks and vice versa by using notes
- defineable alerts
- print of ToDo-list (creates a PDF-document which can be printed)
- switchable display between hourly and quarterly tasks
- search strings in tasks
- Integration of Skype – start a call direct from the Contact Manager

Overview:

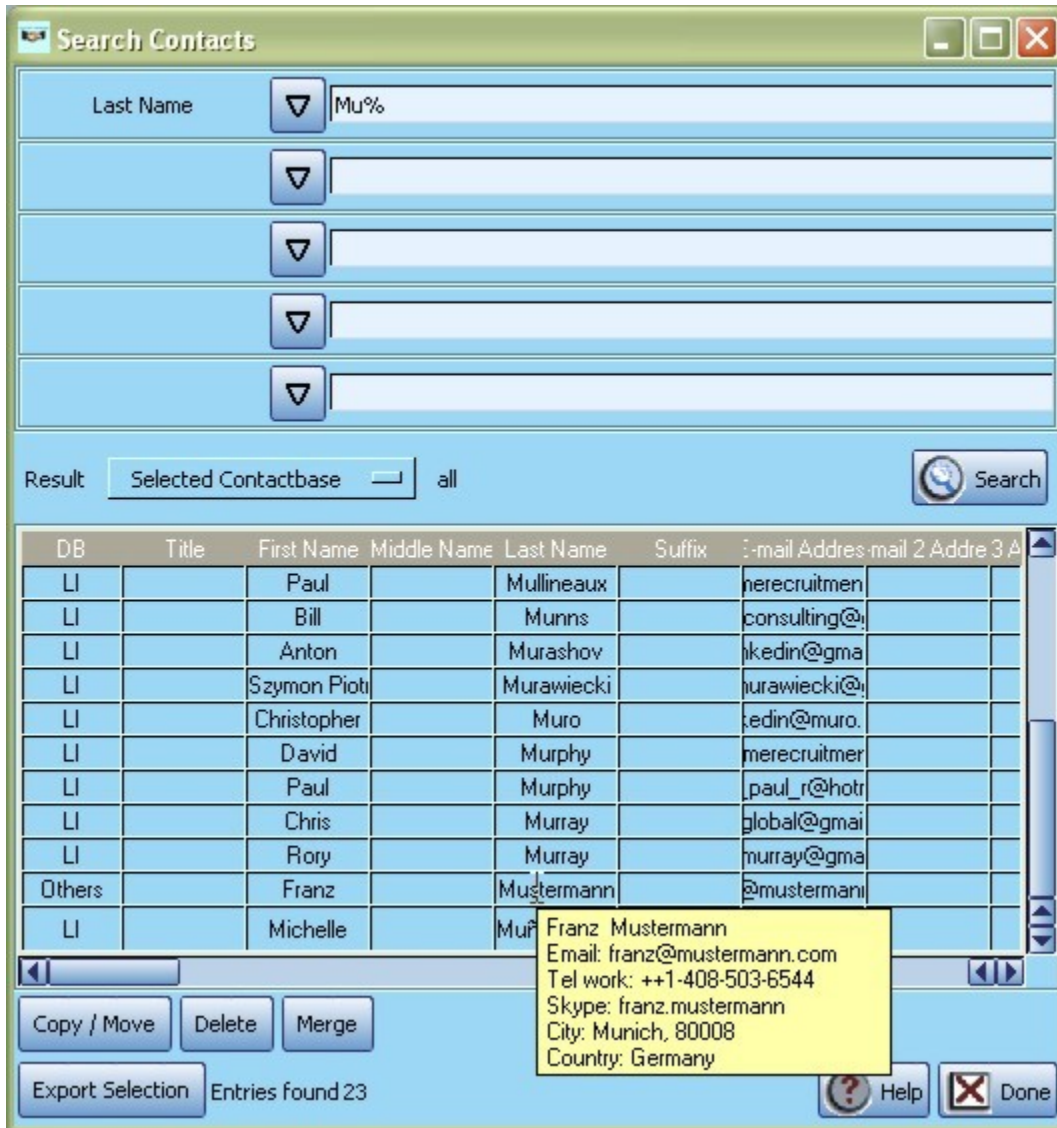

When you start the application you get this window:

This is the entry-point to the Contact Management System. A name-search can be started immediately from here. In case the result is unique the Contact-Sheet will be opened immediately, otherwise the Search-window will be displayed to make a final selection.

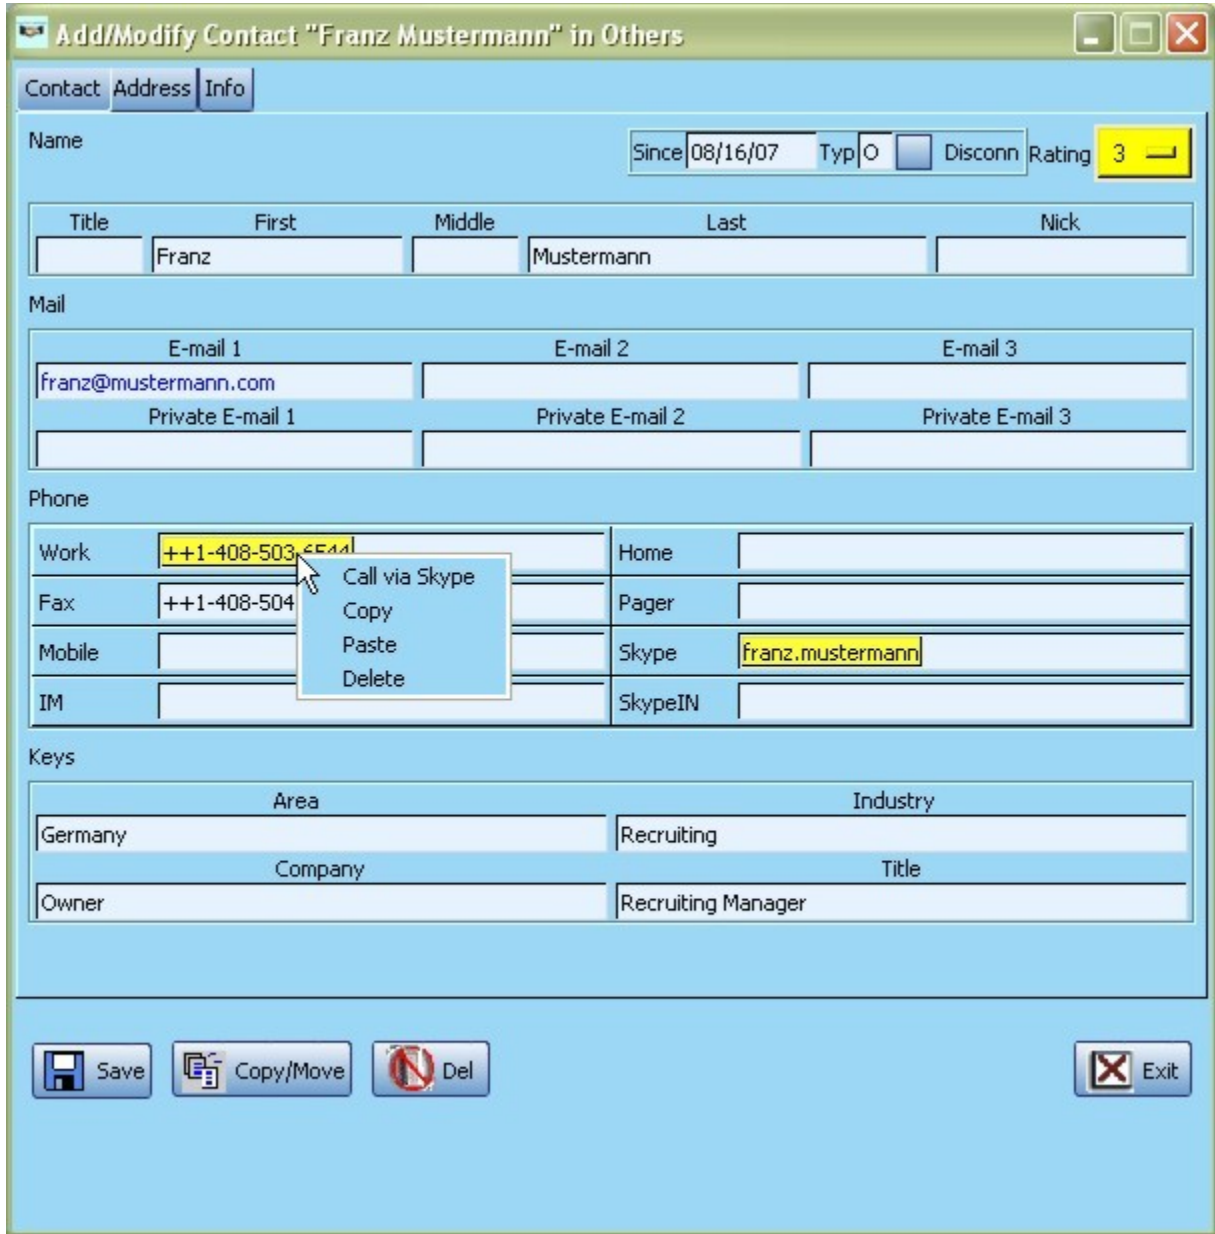

At the bottom there are the main-functions: Search, Edit/Browse Contacts, Scheduler, PLAXO-sync (when enabled) and Help.

Search - enables you to search for every field in the database, also in combination. You don't need to know SQL.

A double-click on a line opens the Contact-editor (description below) to edit data of the contact. Selections can be exported in several formats, eg for round-mails or for use with a text-processor. Searches can be done either in all or a specific ContactBase. Search-items can be restricted or rearranged.

The Contact-Sheet can operate in two different modi: view/edit a selected contact from the Search-window or used in browse-mode. In browse-mode an additional line will be displayed with an alphabet in to to navigate quickly to the first name found with the selected character. Up and Down-buttons make navigation easy.

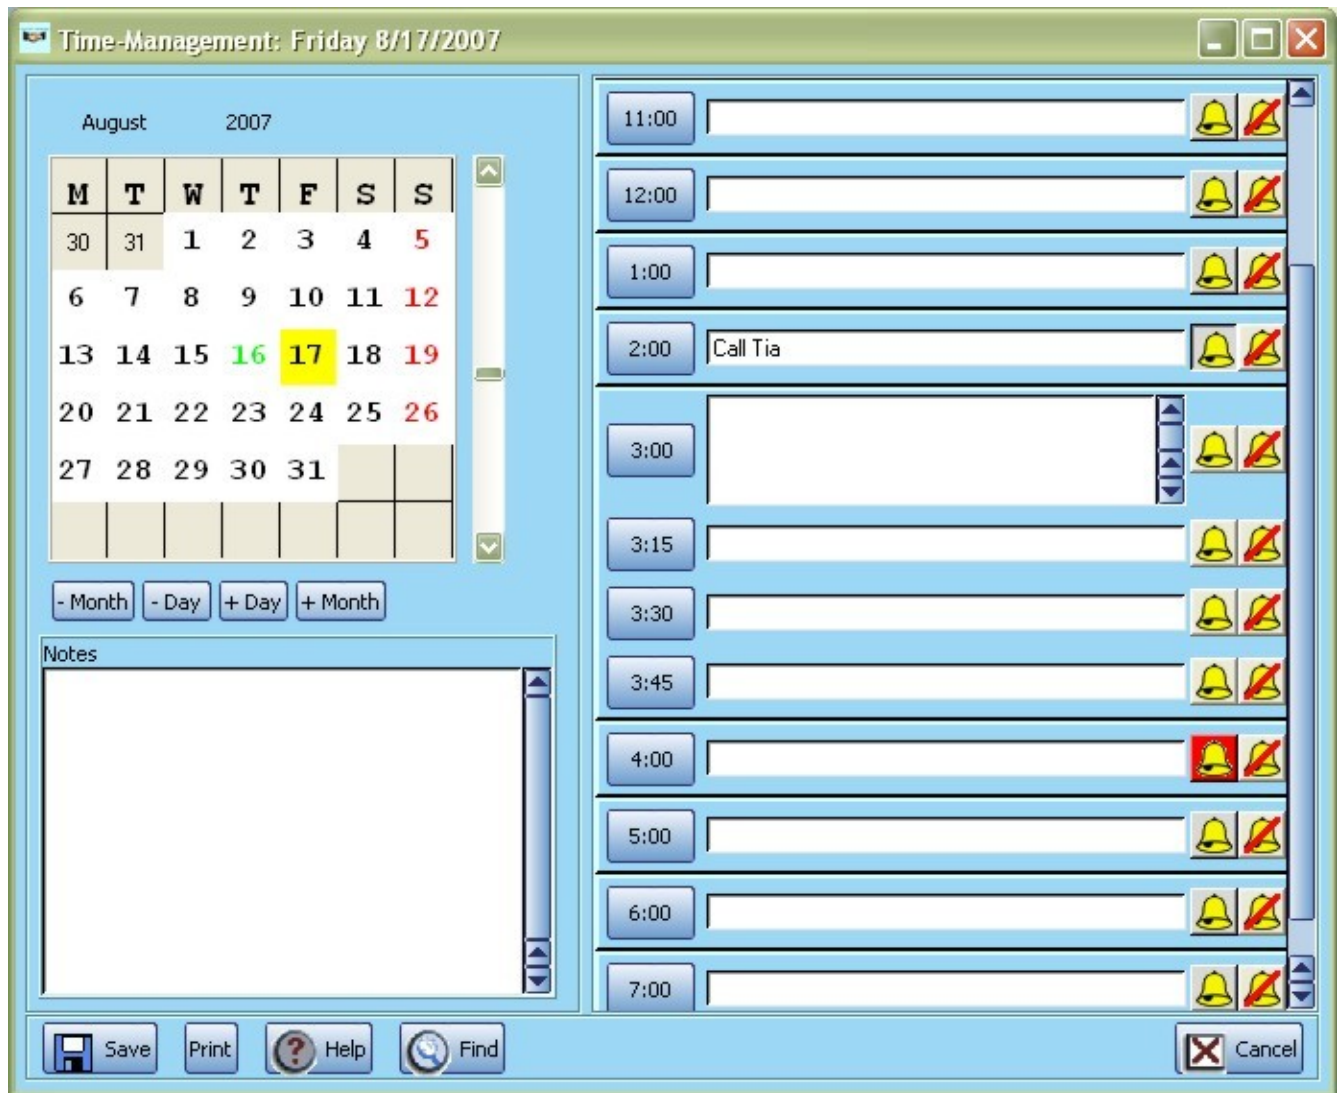

Starting a call via Skype (when activated) or sending an email is just a mouse-click away. Email-addresses per contact can be rearranged to have always the most recent on top.

The other tabs contain address-details, communication-information and the control for the tagging-system. Additionally Birthdays and Anniversaries can be activated with an alert.

The Scheduler

This application schedules my tasks and has even a connection to the contact-database

Every task can be assigned an alert which sends out a reminder 15-60 minutes before. For every task just the first line is shown, by selecting it it expands to 3 lines. With a function-key a full-text-window pops up to edit even bigger text, but text is limited to 2000 characters.

There is a small name-search-functionality embedded which adds name and phone-number automatically to the text.

Every hour can be expanded to enable quarterly entries too.

A text search tool to find strings in all the entries.

A print tool creates a ToDo-list of the selected day in PDF.

Additional information:

- What is a ContactBase? Your contacts can be split into different (virtual) databases, eg your LI-contacts, clients, prospects, etc.
- There are tools available on request to move the content of the database to a mySQL-database (or others).
- Other relational databases will be available on request.
- Other VOIP-interfaces planned for V2.0
- For a multiuser-environment just one mySQL-databases is needed, can even be on a webserver as SSL is supported as well (this is in planning for V2.0).
